

Decoration of Tin bread

Danmatic have engineered and provided equipment for decoration of bakery products over the last 20 years. This has given, and still gives us, many exciting challenges.

One of these challenges has always been decoration of Tin bread. We believe that everybody in the business had the same idea; Why not decorate the product before we deposit the dough piece into the tin? How can we get a better adherence of the topping?

Through several years we have applied liquid on top of the products by means of rollers. Here we can use different liquids which bind the material significantly better than water, and at the same time we can reuse the surplus topping material and hereby reduce the expenses.

But how can we place the product into the tin with the topping facing up every time?

We have faced this question countless times.

We set a goal - this challenge had to be solved - and we did it!

We have developed a special Twin servo driven Retracting Conveyor which combined with our new Décor Unit solve all these problems.

You now have a production with topping only on the product and not all over the straps and the topping facing up, every time.....

This will decrease your costs on both topping and cleaning, and not to mention a significant lower risk of contamination.

Capacity up to 4.500 pcs / hour

We look forward to introduce this innovation to you. 😊
